-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE <u>3</u> MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE·OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
  Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on <u>05 January 2007</u>.

2a)☐ This action is **FINAL**.   2b)☒ This action is non-final.

3)☐. Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) <u>1-8,11,14-19,21-25 and 28</u> is/are pending in the application.

    4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) <u>1-8, 11, 14-19, 21-25, 28</u> is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☒ The drawing(s) filed on <u>30 September 2003</u> is/are: a)☒ accepted or b)☐ objected to by the Examiner.

    Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

    Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

    a)☐ All   b)☐ Some * c)☐ None of:

      1.☐ Certified copies of the priority documents have been received.

      2.☐ Certified copies of the priority documents have been received in Application No. _____.

      3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

    * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1.   Claims 1-8,11,14-19,21-25 and 28 have been presented for examination.

Claim Objections

2.   Claims 11, 25 and 28 are objected to because of the following informalities: The claims recite the

limitation "wherein the simulation image *is obtaining* by compiling the simulation design" with awkward

phrasing. Examiner recommends Applicants amend aforementioned phrasing to clarify said claims and

avoid confusion.

Claim Rejections - 35 USC § 101

35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition
of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the
conditions and requirements of this title.

3.   Claims 1-8,11,14-19,21-25 and 28 are rejected under 35 U.S.C. 101 because the claimed

invention is directed to non-statutory subject matter. Specifically, the claims do not produce a tangible

result; the comparison result is a result of the comparator but it is not a result of the system. Furthermore,

the comparison result, corrected error of the simulation design and simulator are not tangible. They are

abstract or at best remain within a processor and there is no display or an output generated and therefore

the claims do not enable their usefulness to be realized. The only mention of displaying an error or using

a comparison result for a real world use, is preceded by the phrase "is used to" which indicates intended

use and therefore is not given patentable weight.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness

rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1.   Determining the scope and contents of the prior art.
2.   Ascertaining the differences between the prior art and the claims at issue.
3.   Resolving the level of ordinary skill in the pertinent art.
4.   Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

4.   **Claims 1-5, 7-8, 11, 14-16, 18-19, 21-25, and 28 are rejected** under 35 U.S.C. 103(a) as being

unpatentable over **McNamara et al. (U.S. Patent No. 6,141,630) in view of Cavanaugh et al. (U.S.**

Patent No. 6,871,298 B1).

As per claim 1, McNamara is directed to a system for evaluating a simulation design comprising:

a reference simulator configured to execute a simulation image to obtain golden data, *wherein the*

simulation image is a complied version of the simulation design (**column 5, lines 32-45**); a test simulator

(**column 3, lines 34-37 and Figure 1, testbench 108**) configured to execute the simulation image to

obtain test data, *wherein the test simulator is associated with a first implementation of the simulation*

design and the reference simulator is associated with a second implementation of the simulation design

(**column 4, line 66 – column 5, line 4**); and a comparator configured to generate a comparison result by

comparing a portion of the golden data to a portion of the test data before the execution of the simulation

image on the test simulator has completed **(column 7, lines 18-36)** wherein user data is used by the

comparator to select the portion of the golden data and the portion of the test data **(column 4, lines 46-57**

and column 5, 38-57); and wherein the comparison result is used to debug at least one selected from the

group of the simulation design and the test simulator, by correcting *and displaying* an error detected in the

comparison result **(column 7, lines 19-31)** but fails to explicitly disclose *wherein the user data comprises*

a plurality of mapping rules used by the comparator to map the first implementation of the simulation

design to the second implementation of the simulation design.

Cavanaugh teaches *wherein the user data comprises a plurality of mapping rules used by the*

comparator to map the first implementation of the simulation design to the second implementation of the

simulation design **(column 6, line 39 – column 7, line 13)**. It would have been obvious to an ordinary

person skilled in the art at the time of the invention to combine the method of verifying a simulation

design of McNamara with the user data of Cavanaugh in order to provide greater test coverage than static

testing in a shorter amount of time **(column 2, lines 39-47)**.

As per claim 2, the combination of McNamara and Cavanaugh already discloses the system of

claim 1 further comprising: a golden data repository storing the golden data **(column 5, lines 32-45)**; and

a compiler configured to generate the simulation image by compiling the simulation design and user data

(column 7, lines 12-19).

As per claim 3, the combination of McNamara and Cavanaugh already discloses the system of

claim 1, wherein comparing the portion of the golden data to the portion of the test data occurs

dynamically **(column 7, lines 19-36)**.

As per claim 4, the combination of McNamara and Cavanaugh already discloses the system of

claim 3 further comprising: a buffer to store the golden data **(column 5, lines 32-45)**.

As per claim 5, the combination of McNamara and Cavanaugh already discloses the system of claim 4, wherein the comparator is configured to wait to compare the portion of the test data until after the golden data is stored in the buffer (column 5, lines 32-45).

As per claim 7, the combination of McNamara and Cavanaugh already discloses the system of claim 2, wherein user data is obtained before the test simulator has completed executing the simulation image (column 4, lines 46-57).

As per claim 8, the combination of McNamara and Cavanaugh already discloses the system of claim 7, wherein user data is obtained while the test simulator is halted (column 4, lines 46-57).

As per claim 11, McNamara is directed to a method of evaluating a simulation design comprising: executing a simulation image on a reference simulator to obtain golden data, *wherein the simulation image is obtaining by compiling the simulation design* (column 5, lines 32-45); executing the simulation image on a test simulator, *wherein the test simulator is associated with a first implementation of the simulation design and the reference simulator is associated with a second implementation of the* *simulation design* (column 3, lines 34-37 and Figure 1, testbench 108) to obtain test data (column 4, line 66 – column 5, line 4); selecting a portion of the golden data and a portion of the test data (column 4, lines 46-57 and column 5, 38-57); and comparing the selected portion of the golden data to the selected portion of the test data to obtain a comparison result (column 7, lines 18-36) wherein user data is used to select the portion of the golden data and the portion of the test data, and wherein the comparison result is used to debug at least one selected from the group of the simulation design and the test simulator, by correcting *and displaying* an error detected in the comparison result (column 7, lines 19-31) but fails to explicitly disclose *wherein the user data comprises a plurality of mapping rules used by the comparator to map the first implementation of the simulation design to the second implementation of the simulation design.*

Cavanaugh teaches *wherein the user data comprises a plurality of mapping rules used by the comparator to map the first implementation of the simulation design to the second implementation of the simulation design* (**column 6, line 39 – column 7, line 13**). It would have been obvious to an ordinary person skilled in the art at the time of the invention to combine the method of verifying a simulation design of McNamara with the user data of Cavanaugh in order to provide greater test coverage than static testing in a shorter amount of time (**column 2, lines 39-47**).

As per claim 14, the combination of McNamara and Cavanaugh already discloses the method of claim 11 further comprising: compiling the simulation design to obtain the simulation image (**column 7, lines 12-19**).

As per claim 15, the combination of McNamara and Cavanaugh already discloses the method of claim 11 further comprising: storing the golden data in a golden data repository (**column 5, lines 32-45**).

As per claim 16, the combination of McNamara and Cavanaugh already discloses the method of claim 11, wherein the step of selecting a portion of the golden data is performed dynamically (**column 4, lines 46-57**).

As per claim 18, the combination of McNamara and Cavanaugh already discloses the method of claim 11, wherein the step of comparing the selected golden data to the selected test data waits on storing the golden data in a buffer (**column 5, lines 32-45**).

As per claim 19, the combination of McNamara and Cavanaugh already discloses the method of claim 11, wherein the step of selecting a portion of the test data is performed dynamically (**column 4, lines 46-57**).

As per claim 21, the combination of McNamara and Cavanaugh already discloses the method of claim 20, wherein user data is obtained during the step of executing the simulation image on the test simulator (**column 7, lines 12-19**).

As per **claim 22**, the combination of McNamara and Cavanaugh already discloses the method of claim 21, wherein the step of executing the simulation image is halted to obtain the user data **(column 4, lines 46-57)**.

As per **claim 23**, the combination of McNamara and Cavanaugh already discloses the method of claim 20, wherein user data comprises a mapping rule to map an implementation of the simulation design for the test simulator to an implementation of the simulation design for the reference simulator **(column 5, lines 46-54)**.

As per **claim 24**, the combination of McNamara and Cavanaugh already discloses the method of claim 11, wherein the step of comparing the selected golden data to the selected test data is performed before completing the step of executing the simulation image on the test simulator **(column 7, lines 18-36)**.

As per **claim 25**, McNamara is directed to a computer system for evaluating a simulation *design* comprising: a processor; a memory; a storage device; and software instructions **(column 6, lines 20-31)** stored in the memory for enabling the computer system to perform method steps with the same limitations as claim 11 and is therefore rejected over the same prior art combination.

As per **claim 28**, McNamara is directed to an apparatus **(column 6, lines 20-31)** for evaluating a simulation *design* comprising means for method steps with the same limitations as claims 11 and is therefore rejected over the same prior art combination.

5.   **Claims 6 and 17** are rejected under 35 U.S.C. 103(a) as being unpatentable over McNamara et al. (U.S. Patent No. 6,141,630) in view of Cavanaugh et al. (U.S. Patent No. 6,871,298 B1) **in further view of Davidson et al (U.S. Patent No. 6,886,145 B2).**

As per **claim 6**, the combination of McNamara and Cavanaugh is directed to the system of claim 5, but fails to disclose wherein the test simulator and the reference simulator execute the simulation image in lockstep.

Davidson teaches verification of partitioned testbenches in parallel **(column 8, lines 10-17)**. McNamara, Cavanaugh and Davidson are analogous art because they are from the same field of endeavor, verifying and validating circuit designs. It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the system of verifying a circuit design of McNamara and Cavanaugh with the lockstep simulations of Davidson in order to shorten the verification time **(column 1, lines 46-51)**.

As per claim 17, the combination of McNamara and Cavanaugh is directed to the method of claim 16, but fails to disclose wherein the step of executing the simulation image on the test simulator and the step of executing the simulation image on the reference simulator is performed in lockstep. Davidson teaches verification of partitioned testbenches in parallel **(column 8, lines 10-17)**. McNamara, Cavanaugh and Davidson are analogous art because they are from the same field of endeavor, verifying and validating circuit designs. It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the method of verifying a circuit design of McNamara and Cavanaugh with the lockstep simulations of Davidson in order to shorten the verification time **(column 1, lines 46-51)**.

Response to Arguments

6.   Applicant's arguments filed 01/05/07 have been fully considered but they are not persuasive.

7.   The 35 U.S.C. 101 rejection is maintained. Claims 1-8,11,14-19,21-25 and 28 still do not produce a tangible result; the comparison result is a result of the comparator but it is not a result of the system. Furthermore, the comparison result, corrected error of the simulation design and simulator are not tangible. They are abstract or at best remain within a processor and there is no display or an output generated and therefore the claims do not enable their usefulness to be realized. The only mention of displaying an error or using a comparison result for a real world use, is preceded by the phrase "is used to" which indicates intended use and therefore is not given patentable weight.

8.   The 35 U.S.C. 112 rejections have been withdrawn due to the amended claims.

9.   In response to Applicant's argument that McNamara does not teach or suggest mapping rules that

are used to map a first implementation of the simulation design associated with the test simulator to a

second implementation of the simulation design, such mapping rules are inherent the system and method

of McNamara as McNamara teaches two implementations of a simulation design, one with more

precision and one with less precision **(column 5, lines 32-45 and column 3, lines 34-37)**. As the two

implementations are compared to one another to identify errors or faults **(column 7, lines 18-36)**,

mapping rules as inherent and necessary for McNamara to correctly compare the two implementations of

a simulation design.

10.   In response to Applicant's argument that McNamara does not contemplate two different

implementations of a simulated design, where one implementation is for a test simulator and the other

implementation is for a reference simulator, Applicant is respectfully directed to **column 5, lines 32-45**

for a reference simulator and to **column 3, lines 34-37** for a test simulator as stated in both previous office

actions.

11.   In response to Applicant's argument that McNamara does not disclose that the user data

comprises the mapping rules is moot in view of the new grounds of rejection.

Conclusion

12.   The prior art made of record is not relied upon because it is cumulative to the applied rejection.
